nSpaces is a useful software program that allows you to switch through multiple desktops. This kind of tool can be of assistance if you are used to working in multi-tasking mode, since it can significantly simplify your tasks. The app's features can be accessed by opening the right-click menu on nSpaces's icon placed in the system tray area. So, you can add as many desktop spaces as you want, by increasing the number of rows and columns. For each space you can specify a label and edit the font color, opacity level and position. But you can also apply a BMP or JPG image from your computer as wallpaper and set its position (center, tile, stretch), modify the default desktop background color, and set up a list of apps to be automatically opened once you switch to the respective space. Furthermore, you can configure some keyboard shortcuts for immediately jumping to another space, as well as set up passwords (for the program and for individual spaces). Moreover, you can make nSpaces automatically run at system startup and to show the background images on each thumbnail, as well as lock it (unlocking it requires you to input the program password). The latter option can be valuable if you share your computer with multiple users. The simple-to-use tool runs on a low amount of CPU and system memory, has a good response time, and includes a quick start guide for inexperienced users. However, we have noticed two major issues during our evaluation - if you are required to input a password when switching to another space but choose to cancel the dialog, the action is performed anyway. Plus, some global keyboard shortcuts are either disabled or overwritten by nSpaces's hotkeys, while the app is active. Other than that, the program can be handled even by first-time users.
